LegacyLocal

Deep Innovation Report

Executive Summary

A hyper-local digital suite designed specifically for traditional, family-owned high street shops in BCP.

Enables independent merchants to build custom online storefronts, manage consolidated local deliveries, and foster community loyalty.

Bridges the gap between physical retail heritage and modern convenience to support year-round town centre economic growth.

The Better Everyday

What if digital transformation didn't mean losing the human touch of beloved independent high street merchants? Osiris-style digital integration.

- LegacyLocal is a digital toolkit helping family-owned shops establish an online presence while preserving their unique local heritage. The sketch shows a classic storefront with a scalloped awning and a hanging sign. This highlights the warm high street character the platform preserves online.
- By 2030, a Westbourne resident can order specialty ingredients from three local family grocers using a single, consolidated digital checkout. A local cargo bike courier delivers the order within hours. This means busy residents no longer spend Saturday mornings driving between scattered high street shops, reducing emissions and keeping retail active.
- People want to support independent shops and keep high streets alive, but modern convenience often pushes them toward global e-commerce giants. Today, shoppers must manage disjointed social media messages or rush to shops during limited opening hours. This clumsy workaround fails when busy work schedules interfere.
- This platform creates an expectation that independent shops can offer the same digital convenience as multinational retailers. Once consumers experience this seamless local digital integration, they will demand similar ease from public libraries and other municipal services.

Who It Could Matter To

Bridging the digital divide for local shopkeepers and time-poor residents creates a more resilient high street ecosystem.

The Third-Generation Florist

- She runs a long-standing family flower shop in Boscombe but struggles to compete with online delivery networks.
- She encounters LegacyLocal when looking for an affordable way to manage seasonal peak orders without paying high platform commissions.
- She gains a simple digital storefront that preserves her shop's story while automating local deliveries.

The Working Parent

- He lives in Poole Quay and works long hours. He wants local food but cannot visit physical shops during the day.
- He discovers the platform through a neighbourhood social media group showcasing local family-owned butchers and bakers.
- He gets a reliable evening delivery window and the satisfaction of keeping his spending within the local economy.

The Local Cargo Bike Courier

- She is an independent courier who wants predictable, aggregated delivery routes within BCP rather than driving long distances.
- She connects with LegacyLocal to offer zero-emission delivery services to a collective of nearby shopkeepers.
- She receives a steady stream of consolidated, short-distance deliveries that make her local business economically viable.

What This Could Change for BCP

Empowering independent shops with modern digital tools secures the unique character of BCP's distinct coastal town centres.

- The platform leverages BCP's active tech sector, supported by Silicon South, to build local-fit retail solutions. This partnership directly supports the council's ambition for sustainable, year-round growth in town centres.
- Lowering the digital barrier helps family retailers capture spend currently lost to global platforms. This diversifies revenue streams and helps independent businesses survive quiet winter months.
- Successful online sales may reduce shop requirements for physical storage, freeing up town centre real estate. This could make room for pop-up markets or creative workspaces.
- While merchants benefit, traditional distributors must adapt to smaller, more frequent shipments. Local business groups must decide how to manage curb space for cargo bike loading.

Who Must Connect

Bringing together tech talent and heritage retailers requires trusted intermediaries and a commitment to shared infrastructure.

- A local software cooperative will act as operator, partnering with the Bournemouth Chamber of Trade. Developers provide technical skills, while the chamber offers trusted access to traditional shopkeepers.
- Shop owners will form an advisory panel to co-design the digital tools. This ensures the software reflects physical retail workflows rather than imposing complex systems.
- The council can offer micro-grants for digital adoption and allocate space for cargo bike hubs. This support reduces initial risk and provides necessary delivery infrastructure.
- A flat-rate monthly merchant subscription will sustain the service, avoiding high commission fees. Part of this revenue will fund shared marketing and seasonal delivery logistics.
- The missing link is the connection between local software developers and non-technical shop owners. A business association must make the first move by hosting informal cafe meetups.

Why This Fails

Even the most elegant software will fail if it adds friction to busy shopkeepers or lacks reliable local fulfilment.

- **Siloed digital abandonment** occurs when busy shopkeepers find online inventory too slow to manage. The warning sign is a drop in active digital listings within a month.
- **Logistical gridlock** happens if the delivery network lacks couriers during busy periods. The warning sign is delayed deliveries or shopkeepers driving orders home themselves.
- **Convenience fatigue** sets in if ordering feels slower than global marketplace apps. The first indicator is a drop in repeat purchases after the launch phase.

One Experiment to Start

A low-tech pilot can test whether traditional merchants and local shoppers will actually use a shared digital channel.

- The key uncertainty is whether busy shopkeepers will keep digital inventory updated. If administrative work is too slow, the promise of real-time stock fails.
- Test this with a fortnight pilot in Westbourne using a simple WhatsApp group and one cargo bike courier. Three family-owned shops will share a single digital catalog.
- Keep going if shopkeepers fulfill digital orders smoothly and want better tools. Stop or rethink if messaging causes friction on the physical shop floor.
- **Next step:** A business association representative should visit five Westbourne shops next week to pitch the pilot and recruit participants.
